## It Happened to Me—It Could Happen to You

### REAL WORLD FIX

- During routine service, I rotated the tires on a Pontiac Trans Am. Everything went well and I even used a torque wrench to properly torque all of the lug nuts. Then, when I went to drive the car out of the service stall, I heard a horrible grinding sound. When I hoisted the car to investigate, I discovered that the front wheels were hitting the outer tie rod ends. The 16-in. wheels had a different back spacing front and rear, and therefore these wheels could not be rotated. Always check replacement or aftermarket wheels for proper fit before driving the vehicle.
